# ICT373: Lab THREE

## Lab Practice Session 3

1. Write and test an HTML page containing internal links (i.e., a link to take you somewhere else in the same page) and a form containing two text boxes and a button (which sends the info to <http://www.it.murdoch.edu.au/cgi-bin/reply1.pl>). [as with other exercises in ICT373, and as in real life, you may need to do a bit of research here: chase up information via the Web or look at other people's source code]
2. Add a JavaScript function to add the contents of one box to the other (assuming that they contain numbers). Replace the submit button by an “add” button so that the JavaScript function is called when the button is pressed.
3. Add JavaScript functions to check the text box input and display an error message in an alert box. Use run-time checking to check that a text box contains a number. Develop it as a user interface to validate user input before allowing it to be submitted to the CGI program. Add batch processing to check for numbers.
